How to move your farming business forward

To help support you we've trained all of our 130 agriculture managers across the UK in sustainability and agri-tech, so that you can make plans for streamlining your business with confidence.

If you're looking to drive sustainability and efficiency in your farming business, we could help. Your projects could include:

- Carbon sequestration – ranging from carbon capture and storage to diversifying or changing land use on your farm to aid carbon capture
- Carbon assessment/emission reduction – understanding your carbon footprint is integral to driving lower energy usage for your business – this can be achieved through investment in low-emission vehicles, generating your own power from biomass, combined heat and power (CHP), ground source heat pumps (GSHP) or investing in new, energy-efficient buildings
- Soil health – projects that focus on soil can increase soil organic matter, reduce water or wind erosion, enhance fertility and support carbon sequestration
- Natural capital – recognising the natural resources around the landscape of your farming business, while looking to harness other resources like solar, wind and water to help become more carbon neutral through producing your own energy.
